pdf action

1. pdf action
 1. Purpose
 2. Calling sequence
 3. Procedure
 4. Installation
 5. Optional: customizing styles
 6. Modification History
2. Discussion

Purpose

This action is used to get a pdf copy of the page.

It does an on-the-fly, server-side, html to pdf conversion using *html/doc*, and sends an application/pdf content to the web browser.

Calling sequence

`http://my.server/MyWiki/MyPage?action=pdf`

`http://my.server/MyWiki/MyPage?action=pdf&style=NAME`

`http://my.server/MyWiki/MyPage?action=pdf&rev=NUM`

`http://my.server/MyWiki/MyPage?action=pdf&pageaction=ACTION`

`http://my.server/MyWiki/MyPage?action=pdf&help`

style:

◊ page or book. These styles can be redefined or extended in the wiki config (see below). Asking for an unknown style will display an error and list available styles.

rev:

◊ Specifies a page version number.

pageaction:

◊ Specifies an action for rendering the page. By default and if omitted, the print action will be used.

help:

◊ Displays this help.

Procedure

Usage:

- Append &action=pdf to any URL
- or insert the macro [[pdf]] (coming soon!) in a page, which will insert a small control panel

Hints:

- In book style, *html/doc* automatically generates a table of contents. This can cause confusion if the [[TableOfContents]] macro is used. The TOC from *html/doc* is looking nicer (has page numbers) but cannot be placed freely in the document.

Upon your liking, either

- ◆ tolerate dual TOCs,
- ◆ or adapt the wiki page for pdf book output: don't use the [[TableOfContents]] macro,
- ◆ or use the macro and disable *htmldoc* TOC globally: redefine the book style with the --no-toc option,
- ◆ or create a style (e.g book-notoc) having the --no-toc option.

Suggestions:

- Modify your themes to include a pdf link/icon besides print.
- Modify the `AttachFile` standard action to add a pdf link.

Installation

1. install *htmldoc* on the wiki server (on a Debian box: `apt-get install htmldoc`)
2. copy the `pdf.py` action to the `data/plugin/action` directory of your wiki

Optional: customizing styles

To install new styles, or modify the default ones, edit `wikiconfig.py` and add:

```
htmldoc_styles = {
    "page": [
        "--verbose --no-localfiles --no-compression --jpeg " \
        "--header t.D --footer ./ --size a4 --left 0.5in " \
        "--webpage",
    "book": [
        "--verbose --no-localfiles --no-compression --jpeg " \
        "--header t.D --footer ./ --size a4 --left 0.5in",
    ]
}
```

By this means, you can change the page format from `a4` to `letter`, or add new styles to the dictionary.

For a complete list of available *htmldoc* options, see <http://www.easysw.com/htmldoc/docfiles/8-cmdref.html>
